Retail Sales & Profit Analysis

Business insight report based on the supplied dashboard screenshots **Prepared by Vithya Sri**

Dashboard overview

The dashboard combines revenue, cost, profit, quantity and transaction counts. Charts break revenue down by store type, product category, store, city and month, with slicers for date, store name, state and customer segment.

Headline figures: Total revenue 4.71bn | Total cost ~4bn | Total profit 979.89M | Total quantity 112K | Total transactions 15K | Average order value 313.80K

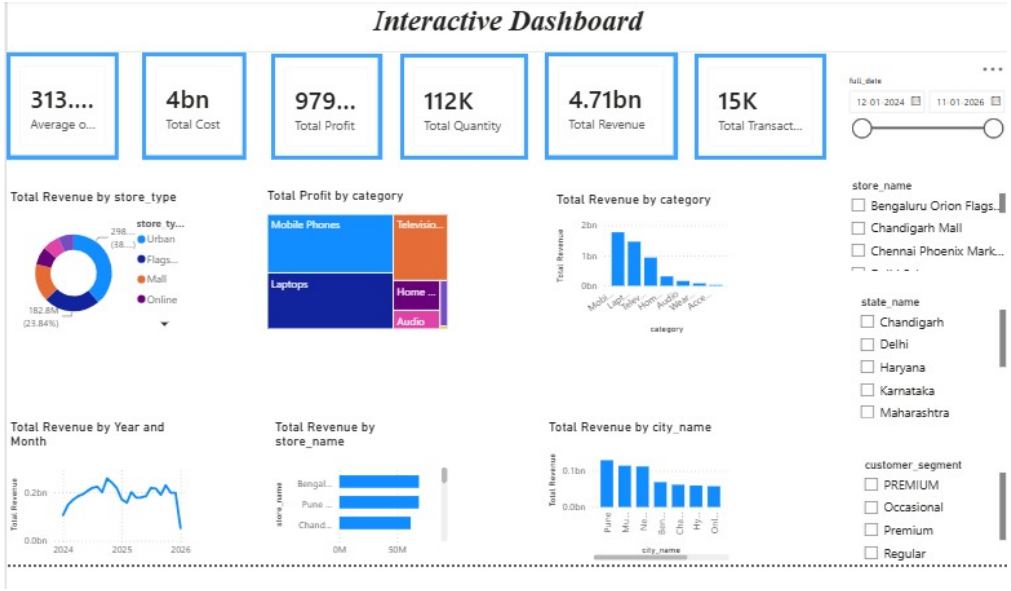

Figure 1. Supplied Interactive Dashboard overview

1. KPI and profitability analysis

Visible dashboard measures, with interpretation limited to the supplied screenshots

KPI	Visible value	Reading
Total revenue	4.71bn	Sum of sales value; currency not shown
Total cost	4bn	Rounded display; implied about 3.73bn (revenue minus profit)
Total profit	979.89M	Revenue less cost
Total quantity	112K	Units sold
Total transactions	15K	Labelled “Total Order” on the cropped KPI card
Average order value	313.80K	Revenue per transaction

The figures hold together. 4.71bn ÷ 15K ≈ 314K, matching the average order value of 313.80K. 979.89M ÷ 4.71bn ≈ **20.8% profit margin**. 112K units over 15K transactions is about **7.5 units per order**, which is high for consumer electronics and is worth checking.

Data caution

- Total cost is shown rounded to 4bn; use the implied ~3.73bn for margin work.
- The store type donut labels (298.03M = 38.87%) imply a total near 767M, well below the 4.71bn KPI. Confirm which measure or filter that chart uses.
- Currency is not displayed. The cities suggest India, but confirm before labelling values.
- The cropped KPI card says “Total Order” while the main view says “Total Transaction”; align the label.

2. Revenue trend and store type mix

Monthly revenue and channel split shown in the supplied dashboard

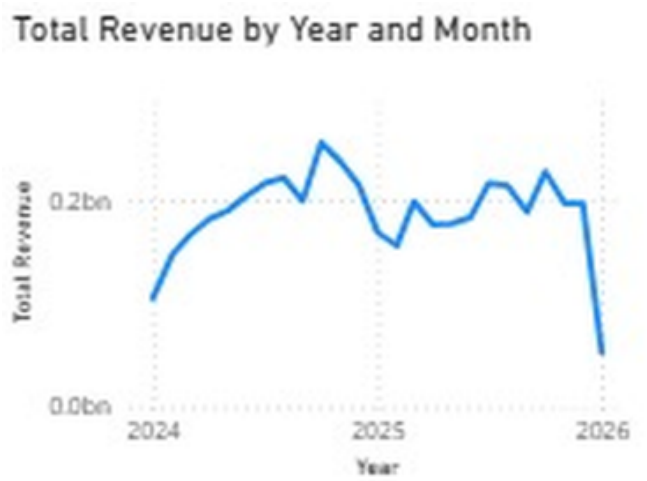

Figure 2. Total revenue by year and month

Figure 3. Total revenue by store type

Revenue trend

Monthly revenue starts near 0.1bn in early 2024, climbs to roughly 0.2–0.25bn by the first half of 2025 with some ups and downs, dips to about 0.17bn around mid-2025, then recovers to about 0.2bn. The line falls sharply to about 0.05bn at the very end.

The date slicer runs 12-01-2024 to 11-01-2026, so the first and last months are likely partial. The final drop is probably an incomplete month rather than a real decline; confirm before reading it as a trend.

Store type mix

Urban stores are the largest channel at 38.87% (298.03M on the label). **Mall** is next at 23.84% (182.8M), followed by Flagship, with Online and a small fourth segment smallest. Online looks like a minor share, so physical stores drive most of the donut.

Chart values are visual estimates where labels are not printed.

3. Category revenue and profit

Which product groups carry the business

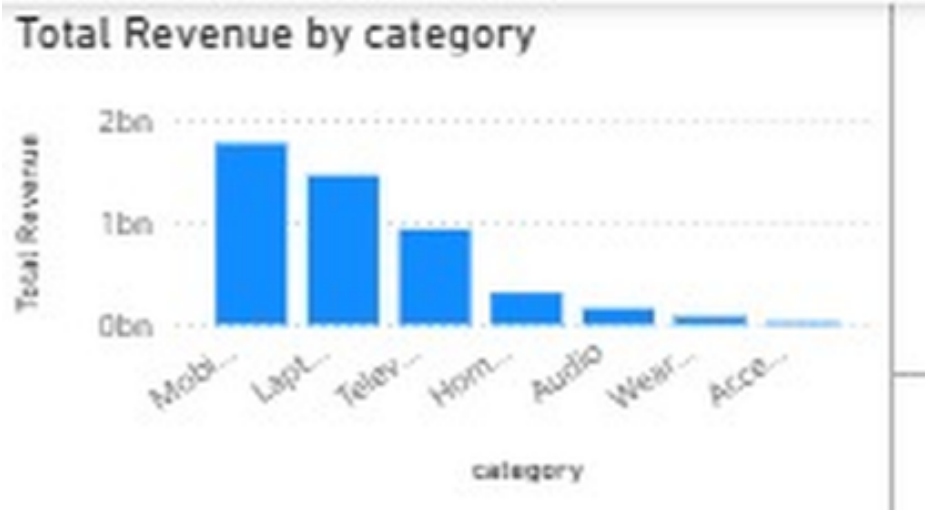

Figure 4. Total revenue by category

Figure 5. Total profit by category

Revenue by category

Mobile Phones lead at about 1.8bn, followed by **Laptops** at about 1.5bn and **Televisions** at about 0.9bn. Home Appliances (~0.3bn), Audio, Wearables and Accessories are much smaller. The top three categories make up the large majority of the 4.71bn.

Profit by category

The treemap ranks Mobile Phones first and Laptops second, then Televisions, Home Appliances and Audio. The order matches revenue, so profit is concentrated where sales are concentrated.

Profit values per category are not printed, so category-level margin cannot be calculated from the screenshots.

4. Stores, cities and customer segments

Location performance and available filters

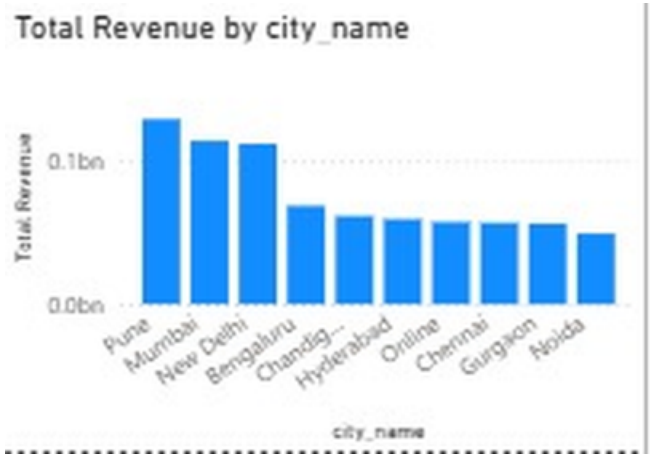

Figure 6. Total revenue by city

Figure 7. Total revenue by store

City performance

Pune is the top city at about 0.12bn, followed by Mumbai and New Delhi at roughly 0.1bn. Bengaluru, Chandigarh, Hyderabad, Online, Chennai, Gurgaon and Noida follow in a fairly even band of about 0.05–0.08bn.

Store performance

The top stores (Bengaluru, Pune Phoenix, Chandigarh) are close together at about 60–65M each, so no single store dominates. The store list is truncated, so the full ranking is not visible.

Slicers and data quality

Slicers cover store name, state (Chandigarh, Delhi, Haryana, Karnataka, Maharashtra) and customer segment. The segment list shows both **PREMIUM** and **Premium**, which looks like a casing inconsistency that splits one segment in two.

Chart values are visual estimates where labels are not printed.

5. Business insights and recommendations

Actions grounded in the visible dashboard patterns

Observation	Profit margin is about 20.8% on 4.71bn revenue (979.89M profit).
Recommendation	Track margin by category and store type to see where it is strongest, and protect it when discounting.
Observation	Mobile Phones, Laptops and Televisions drive most revenue and profit.
Recommendation	Prioritise stock availability and promotions for these three, and review whether smaller categories (Audio, Wearables, Accessories) can be bundled with them.
Observation	Urban and Mall stores generate most revenue; Online is a small share.
Recommendation	Test growth levers for Online, and check whether Flagship stores justify their footprint.
Observation	Pune, Mumbai and New Delhi lead; other cities sit in an even lower band.
Recommendation	Replicate the top-city playbook in mid-tier cities such as Bengaluru, Hyderabad and Chennai.
Observation	Revenue is uneven month to month and the final point drops sharply.
Recommendation	Compare full months only, exclude partial months from trend reads, and plan around the mid-2025 dip.
Observation	Segment values show duplicate casing (PREMIUM vs Premium) and the donut total does not match the 4.71bn KPI.
Recommendation	Clean the segment field and confirm the measure behind the store type chart before sharing the dashboard.

6. Conclusion and data notes

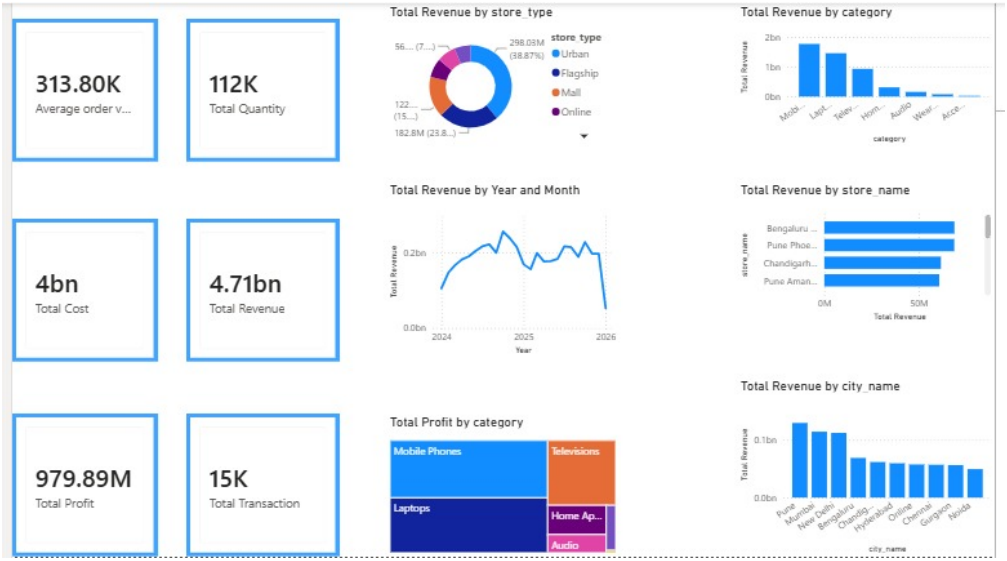

Summary of what the supplied dashboard supports

Conclusion

The dashboard gives a concise view of retail performance: 4.71bn revenue, 979.89M profit (about 20.8% margin), 112K units and 15K transactions. Revenue is concentrated in three categories, in Urban and Mall stores, and in Pune, Mumbai and New Delhi. It supports revenue, profit and mix monitoring, but not conclusions about customer behaviour, discount effects or the cause of the late-period drop.

Data notes

- All figures come from the supplied screenshots; chart readings are visual estimates.
- Total cost is rounded (4bn); ~3.73bn is inferred from revenue minus profit.
- Date range 12-01-2024 to 11-01-2026; first and last months are probably partial.
- Slicer filter state is not documented, and no currency, discount or customer-level data appears.
